# Overview

This piece of software was created to digitalise honour boards and images. The Kissing Point Sports Club was running out of physical space. To solve this problem, we created this piece of software which would essentially take pre-existing photos and excel information, this information. The software is scalable so any new information / photos that are obtained would be easily implemented into the software. This user manual is designed to assist users in implementing new information and answer common questions that may arise. For further information / questions feel free to email: ben.swinbourne@gmail.com

**For information regarding what each button does in the software see Appendix 1.**

## How to Set up the TVs

Connecting to HDMI3 (If Necessary)

If you're not already connected to HDMI3 you will need to connect. You can tell if it's connected if you are prompted with a Pin / Password. If not, you will need the remote to select and navigate to HDMI3, this essentially makes the connection from the TV to the PC.

Launching the App

In the centre of the desktop there should be an app with an atomic symbol. If there is no app with an atomic symbol you will have to use the setup file in the folder in the centre of the desktop. Icon of app and setup file:

Opening the Viewers

From here opening the viewers should be quite easy. You simply click the relevant buttons as directed in Appendix 1. If you want to change which board you want to have on each TV, the board you first open will display on the secondary TV (the TV on the right).

You can use BACKSPACE and F2 to close the viewers. BACKSPACE closes just the boards while F2 closes everything.

# How the Honour Board Works

## How the Honour Board Scrolls

The Honour Board calculates the number of rows in the excel sheet for each board. Based on the number of rows, a calculation is made and an additional buffer is added for error correction. It's difficult to calculate the exact distance for each row, the buffer is made to compensate for this slight miscalculation. Adjusting the buffer fixes any scrolling issues.

## How does the Transition Work

Once it has scrolled the calculated distance down the page, the video will play over the screen. During this process the content from the excel file is essentially switched with another board. This means that there is only one big screen which transition to different excel boards. This saves processing power and reduces the complexity of the system.

## How is the Excel Document Stored

There is an excel document which is permanently stored locally. By using the relevant buttons to update the excel file, you essentially replace the pre-existing excel document with the document you upload.

# How the Photo Board Works

## How are the Photos Stored

The photos are stored locally like the excel file but there are 5 distinct folders relating to each club, for example, there are folders for cricket, football etc.

## Why some Pictures may be Pixelated

The Photo viewer displays images; the quality of the images all depends on the resolution of the photos. If the photos are too small, they may be scaled up to fit the TV screen. Although this can happen for some images, a more likely possibility is that the quality of the photo isn't good enough, having a good camera is crucial in displaying these images.

## How Should I Name the Files

The files will display top to bottom (alphabetically) so it's important to name the photo accordingly. A specific format is recommended but not necessary since it reads top to bottom.

Software Engineer: Ben Swinbourne

## How Do I Update the Excel File

To update the locally stored excel file, you must launch the desktop app and click on the button titled “Edit Honour-Board” as described below:

This will prompt you to upload an excel file. Since the computer doesn’t have Microsoft 365 you will need to make the edits on a separate computer which has Microsoft 365 installed and then use a USB to transfer the excel file.

## How Do I Upload New Images for the Photo Display

To upload new photos to the locally stored file, you must launch the desktop app and click the button titled “Edit Photo-Board” as described below:

This will prompt you with a file where you can freely drag and click photos into their associated folders. Ensure that the files are named correctly so that they are displayed correctly by the board.
